

POOLING OF CENTRAL & STATE SAMPLE DATA OF NSS 68TH ROUND

CONSUMER EXPENTITURE & EMPLOYMENT & UNEMPLOYMENT SURVEY

**GOVERNMENT OF NAGALAND
DIRECTORATE OF ECONOMICS & STATISTICS
NAGALAND : KOHIMA**

PERFACE

The National Statistical Commission (NSC) constituted a Committee on Pooling of Central and State samples of National Sample Surveys (NSS), to identify the preconditions for pooling of Central and State sample NSS data, to suggest appropriate methodology for pooling the data and to bridge the data gaps and in turn strengthen the database for decentralized planning and governance.

The necessity for pooling of Central and State sample NSS data arose due to the growing need for improving the precision of estimates of policy parameters such as the incidence of poverty, State Domestic Product (SDP), District Domestic Product(DDP),etc and for strengthening the database at district level required for decentralized governance.

This publication is, a pooled report of Central and State Samples data of NSS 68th Round using the poolability tests and methodologies for pooling as recommended by the NSC's professional Committee.

Comments and suggestions for improving this report are most welcome.

Kohima

CHAPTER-I

INTRODUCTION

BACKGROUND

One of the objectives of States participation in the NSS programme is to provide a mechanism by which sample size would be increased and the pooling of the two sets of data can be done so as to enable better estimates at lower sub state level, particularly at district level. At the State level, this will result in increased precision of the estimates and at disaggregated level, estimates will be more stable. But the major benefit will be derived in the case of estimates are generated at sub-state level like NSS regions/districts. Although the need for pooling central and state sample data was felt for quite some time and the 13th Finance Commission had also made special provision for additional funds in each district to carry out this exercise, little progress was made in this respect in terms of evolving a uniform methodology of pooling and also testing for poolability of the two sets of data. While some states, of their own, pooled the results of central and state samples for a few NSS rounds, there was a complete lack of uniformity in their approach which resulted in a loss of comparability of such pooled data. It was against this backdrop that the National Statistical Commission appointed a professional committee under the chairmanship of Dr. R. Radhakrishna, Ex-Chairman, National Statistical Commission (NSC) to examine the issues. The Committee in its report gave a detailed methodology for pooling and also the tests for poolability.

Following the recommendations of the Committee, DPD took initiative to provide all kind of technical guidance and support to the states in pooling their data. DPD organized two workshops on “Pooling Central and State sample NSS data” at New Delhi in January and August 2013. A total of about 40 officers from 17 different States participated in the first pooling Workshop. During the second workshop, a total of 30 officers from 12 different States participated. Detailed procedure of carrying out poolability test of two sets of data- both parametric and non-parametric and also of computation of district-level pooled estimates for a set of important indicators were shown and discussed with the States in the said workshops for NSS 66th round survey. DPD took its own initiative to develop customised software for poolability tests of two sets of data which can be applied to data of any NSS rounds. Tabulation software for pooling the central and state sample data of NSS 66th round based upon key parameters were developed by DPD and supplied to state DES for the pooling exercise. The customised poolability test software developed by DPD was also supplied to the State DES along with operational instructions so that states following layout other than central sample data layout can also conduct the poolability test using the software at the desired level of domain. Report of the NSC Committee on pooling was also given to the states.

Subsequently, pooling workshop was merged with the regional GSDP Workshops of NAD where 2 days were devoted to the discussion/training on pooling. 5 such regional workshops were organised in 2014-2015. Hands-on training was also given to the participants in the Workshop.

During deliberations in the GSDP Workshop it was noted the importance of pooling of NSS 67th round and 68th round data of state and central sample data as assumes even greater significance for its use in the National Accounts Statistics.

Generating estimates of GVA per worker based on NSS 67th round data and estimated worker (principal + subsidiary status) based on NSS 68th round data by compilation category after pooling the two sets of data is need of the hour as these two parameters are vital for estimating GVA by Labour Input method used in National Accounts Statistics. The workshop on “Methodology for Poolability and Pooling of NSS data of 67th round” was then held at Sardar Patel Bhawan during 18-19 June 2015 where estimate of worker and GVA per worker was attempted at sector and state level apart from other key parameters at district level after pooling the two sets of data. 50 officers from 22 different States participated in the Workshop, besides officers from D.P. Centres, DPD Head Quarter and CPD.

The household consumer expenditure survey (CES) is generally conducted along with the employment survey of the NSS at quinquennial interval. The NSS consumer expenditure survey aims at generating estimates of average household periodical per capita consumer expenditure (MPCE), the distribution of household and person over the MPCE range, and the break-up of average MPCE by commodity group, separately for the rural and urban sector of the country, for states and union territories, and for different socio-economic group. These indicators and amongst the important measure of the level of living of the relevant domains of the population. The distribution of MPCE highlights the difference of living of the different segments of the population and is an effective tool to study the poverty and inequality. These estimates thus enable the apex planning of decision-making process to allocate the nation's resources among sectors regions and socio-economic groups, and assess the ‘inclusiveness’ of economic growth. Besides measurement of the level and the pattern of household consumption, another important use of CES is to provide the budget shares of different commodity group for the rural and urban population, which are used to prepare the weighing diagram for official consumer price indices (CPIs).

Apart from these major uses of the CES, the food (quantity) consumption data are used to study the level of intake of different nutrients for populations of different regions and disparities therein. Further, the estimated budget shares of a commodity at different MPCE level facilitates the study of consumption elasticity or responsiveness of demand for the commodity to change in purchasing power.

The main objective of the employment and unemployment survey conducted by NSSO at periodic interval is to get estimates of level parameters of various labour force characteristic at the national and state/UT level. These statistical indicators on labour market are required for planning, policy and decision making at various levels, both within the government and outside. The critical issues in the context of labour force enquiries pertain to defining the labour force and measuring participation of the labour force in different economic activities. The activity participation of the people is not only dynamic but also multidimensional- it varies with region, age, education, gender, level of living, industry and occupational category. These aspects of the labour force are captured in detail in the employment and unemployment surveys of NSSO and estimates are generated for labour force participation rate worker population ratio, unemployment rate, extent of under-employment, wage of employees etc. The indicators of the structural aspects of the workforce such as status in employment, industrial distribution and occupational distribution of the workers are also derived from these surveys. Besides, from the data collected on the particulars of enterprises and conditions of employment, the aspects of employment in the formal sector and informal employment are reflected through the conceptual framework of the surveys.

The critical issues in the context of labour force enquiries pertain to defining labour force and measuring participation of labour force in different economic activities. In the employment and unemployment surveys of the quinquennial rounds of NSSO, persons are classified into various activity categories in three approaches on the basis of activities (economic/non-economic) pursued by them during certain specified reference periods. The three approaches are usual status approach, current weekly status approach and the current daily status approach. Three reference periods used in NSS surveys are (i) one year (ii) one week and (iii) each day of the reference week. In the usual status approach, the activity status of a person is determined on the basis of the reference period of one year. The activity status of a person in current weekly status approach is determined on the basis of the reference period of one week and that in current daily status approach is determined on the basis of the reference period of one day. Based on the classification of the individuals into various activity categories in the three approaches, labour force indicators like, labour force participation rate (LFPR), worker population ratio (WPR), unemployment rate(UR) are derived in usual status (PS), usual status (PS + SS),current weekly status (CWS) and current daily status (CDS). As in the past, through the employment and unemployment schedule (schedule 10) of 68th round, NSSO collects data to measure employment and unemployment indicators in terms of usual status (PS), usual status (PS + SS), current weekly status (CWS) and current daily status (CDS)

1.1 Parameters considered for pooling:

Considering the smaller sample size at district level following broad parameters were considered for pooling.

- a) MPCE of FOOD, Non-FOOD, and Total MPCE derived from detail item for URP, MRP and MMRP
- b) Household size, sex, age
- c) Activity status principal, subsidiary, weekly, daily and their intensity
- d) Sector x state wise estimates of Worker in unincorporated non-agricultural enterprises
- e) District level quantile class computation

1.2 Tables generated:

Following Tables were generated for central, state and pooled sample along with RSEs separately for rural and urban sector.

- a) District wise estimated number of households and persons by sex and sex ratio and average MPCE (URP, MRP, MMRP) for schedule type-I and II
- b) District wise Value of consumption (Rs.0.00) of food, non-food and total per person for a period of 30 days for each Quantile class of MPCE (URP, MRP and MMRP)
- c) District wise estimated no of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for PS+SS status
- d) District wise estimated no of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for CWS status
- e) District wise estimated no of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for CDS status
- f) State wise estimate of worker in unorganised and organised sector by NAD compilation category

1.3 Testing the poolability of two sets of data:

District wise following tests were undertaken.

- g) District wise Wald-Wolfowitz run test for MPCE (URP, MRP,MMRP) for central and state sample [non parametric Z-test]
- h) District wise divergence test for MPCE (URP, MRP,MMRP) between central and state sample [parametric Z-test]
- i) District wise distribution test over employed, unemployed and out of labour force.

1.4 Methodology of pooling:

Two alternate methods are used in pooling the central and state sample data.

- a) Weighting by Matching ratio: Building aggregate estimate of pooled sample in proportion matching ratio m:n of central and state sample aggregate estimate where m and n are the allotted sample for central and state sample separately for rural and urban sector. Building ratio estimate of pooled sample as ratio of aggregate estimates.
- b) Weighting by inverse of variance: Ratio estimates are built by weighting the ratio estimate of central and state sample in proportion to inverse of variance of ratio of the central and state sample.

1.5 Presentation of results:

Summary statements of results are placed below both for poolabilty test and pooled results for Nagaland. Details results are also available in excel sheet and print files.

1.6 Sample size:

Total sample size of Nagaland State for central and state sample are given below:

| NAGALAND - RURAL | | | | | | |
|------------------|----------------|-------------|------------------|--------------|-------------|------------------|
